

**Providing a High Quality Supply of Water and  
Reliable Service to All Customers at a Fair and  
Reasonable Rate**

**2019 ANNUAL DRINKING WATER  
QUALITY REPORT**

## About This Report

Bighorn-Desert View Water Agency (BDVWA) is pleased to present you with the Annual Consumer Confidence Report for the Year Ending 2019. Also considered the Drinking Water Quality Report, you will be happy to learn that your water met all US Environmental Protection Agency and California Division of Drinking Water (DDW) Health Standards in 2019.

This report may seem complicated. Please call us at our office should you have any specific questions.

## Our Water Supply

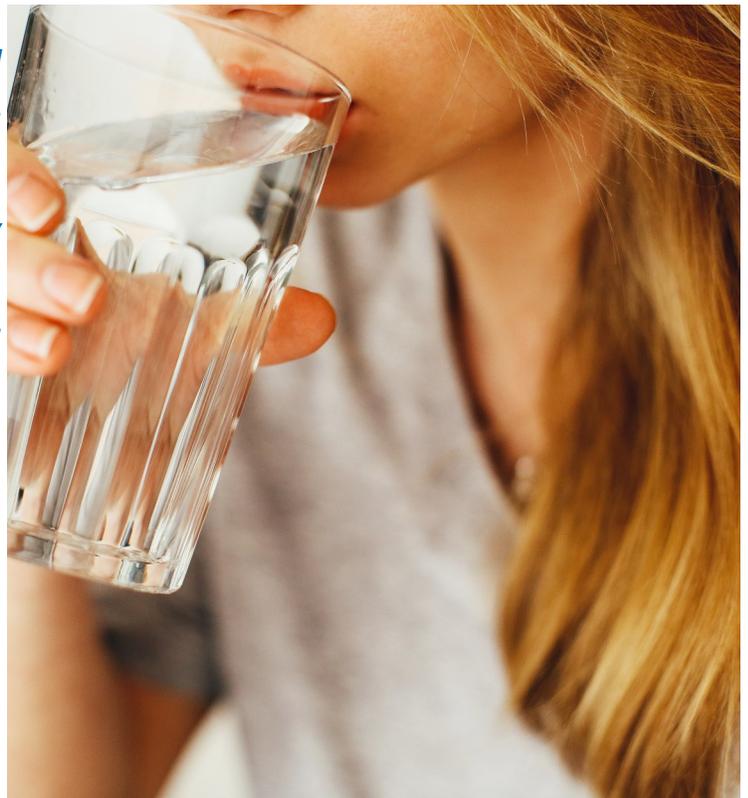

### WHAT IS IN MY WATER?

The sources of all drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, groundwater aquifers, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or human activity. Your water source is groundwater aquifers.

Contaminants that may be present in source water include:

- *Microbial contaminants, such as viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.*
- *Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.*
- *Organic chemical contaminants, including synthetic and volatile organic chemicals that are byproducts of industrial processes and petroleum production. Contaminants can also come from gas stations, urban storm water runoff, and septic systems.*
- *Radioactive contaminants that can be naturally occurring or the result of oil and gas production and mining activities.*
- *Pesticides and herbicides that may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.*

In order to ensure that tap water is safe to drink, U.S. Environmental Protection Agency (USEPA) and the California Department of Public Health prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. Department regulations also establish limits for contaminants in

bottled water that must provide the same protection for public health.

## DIVERSIFYING OUR WATER SUPPLY

Water supply diversification is a mechanism used in water management to avoid the unnecessary depletion of natural resources in order to maintain balance of all resources. In the case of your water agency, diversification allows us to utilize a water source from outside the service area to supplement native groundwater supplies.

This is done through a process known as groundwater recharge. The agency purchases water that falls as rain in the mountains of Northern California, transported through a system of canals, pipelines and pump stations (The California State Water Project) to the Mojave Water Agency. It is then transported to Landers via the

Photo courtesy of Marina West

### Natural Recharge Local Mountain Snowpack & Rain

Morongo Basin Pipeline where it is released into an artificial pond. The water percolates and is safely stored underground to be retrieved as needed. To date the Agency has recharged a total of 450 Acre-Feet. For comparison our 2,550 service connections averaged 0.2 acre-feet per year. Last year the Agency served a total of 543 Acre-Feet (one acre-foot is 325,829 gallons).

### Artificial Recharge at the Ames/Reche Groundwater Storage & Recovery Facility

# Water Quality Analysis Results

**The Bighorn-Desert View Water Agency** encompasses 59-square miles and operates three

distinct water systems: Bighorn-Desert View (BDV); Improvement District Goat Mountain (ID GM) and Johnson Valley Bulk Hauling Station (Well 10). There are five wells serving BDV, two wells serving ID GM and one well in Johnson Valley. The wells pump from the Ames-Means Valley and the Johnson Valley Groundwater Basins. The tables on the following pages show a summary of the actual test results of your drinking water from each different water system and compares them with constituent level limits and goals set by the U.S. EPA to ensure your tap water is

safe. Over 1,650 distinct water quality parameters were analyzed in 2019. Some of the constituents in this report reflect those which have exceeded the Detection Level for Reporting Purposes but have not exceeded the Maximum Contaminant Level. Others such as Sodium and Hardness are listed for information only. Lastly, the State allows us to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of our data, though representative, are more than one year old as indicated by the “sample year”.

Over 1,650 distinct water quality analysis completed in 2019

### Important Health Information

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants and native trace elements. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. Environmental Protection Agency's (USEPA) Safe Drinking Water Hotline at 1-800-426-4791. Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders and some elderly and infants can be particularly at-risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on the appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

### Health Effects

**Arsenic** - While your drinking water meets the federal and state standard for arsenic (10 parts per billion), it does contain low levels of arsenic. The arsenic standard balances the current understanding of arsenic's possible health effects against the costs of removing arsenic from drinking water. The U.S. Environmental Protection Agency continues to research the health effects of low levels of arsenic, which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems.

**Fluoride** - Some people who drink water containing fluoride in excess of the federal Maximum Contaminant Level (MCL) of 4 mg/L over many years may get bone disease, including pain and tenderness of the bones. Children who drink water containing fluoride in excess of the state MCL of 2 mg/L, may get mottled teeth.

**Nitrate** - Infants below the age of six months who drink water containing nitrate in excess of the MCL may quickly become seriously ill and, if untreated, may die because high nitrate levels can interfere with the capacity of the infant's blood to carry oxygen. Symptoms include shortness of breath and blueness of the skin. High nitrate levels may also affect the oxygen-carrying ability of the blood in pregnant women.

**Gross Alpha** - Certain minerals are radioactive and may emit a form of radiation known as alpha radiation. Some people who drink water containing alpha emitters in excess of the MCL over many years may have an increased risk of getting cancer.

**Uranium** - Some people who drink water containing uranium in excess of the MCL over many years may have kidney problems or an increased risk of getting cancer.

**Unregulated Contaminant Monitoring** - Helps the USEPA and the California Department of Public Health to determine where certain contaminants occur and whether the contaminants require regulation.

**Hexavalent Chromium** - Some people who drink water containing hexavalent chromium in excess of the MCL over many years may have an increased risk of getting cancer.

## How to Read the Tables

The tables on the following pages list parameters which California Department of Drinking Water (DDW) requires the Agency to monitor, which may be associated with primary (health), secondary (aesthetic), or no established standards. The tables summarize monitoring from January 2019 - December 2019, and may include earlier monitoring data. The tables list all parameters that were detected at or above DDW's Detection Limit for Purposes of Reporting (DLR) from over 1,650 analysis from water well and distribution system sampling points.

## Abbreviations

- **AL** - Regulatory Action Level.
- **BDVWA** - Bighorn-Desert View Water Agency.
- **DDW** - State Water Resources Control Board Division of Drinking Water Programs.
- **DLR** - Detection limit for reporting.
- **DPH** - Department of Public Health.
- **CL2** - Free Chlorine Residual.
- **MCL** - Maximum Contaminant Level.
- **MCLG** - Maximum Contaminant Level Goal.
- **MRDL** - Maximum Residual Disinfectant Level.
- **ND** - Not Detectable at Testing Limit.
- **N/A** - Not Applicable.
- **NTU** - Nephelometric Turbidity Unit.
- **OU** - Odor Unit.
- **pCi/L** - PicoCuries Per Liter (a measure of radiation).
- **PDWS** - Primary Drinking Water Standard.
- **PHG** - Public Health Goals.
- **ppb** - Parts Per Billion or Micrograms Per Liter (ug/L) - [1ppb= 0.001 ppm].
- **ppm** - Parts Per Million or Milligrams Per Liter (mg/L) - [1ppm=1,000 ppb]. Or one drop in an Olympic sized swimming pool.
- **SDWS**- Secondary Drinking Water Standards.

## Definition of Terms

**Maximum Contaminant Level (MCL)** - The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the Public Health Goals (or MCLGs) as is economically and technologically feasible. The U.S. Environmental Protection Agency sets secondary MCLGs.

**Secondary Drinking Water Standards (SDWS)** - MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.

**Public Health Goals (PHG)** - The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

**Maximum Contaminant Level Goal (MCLG)** - The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency.

**Primary Drinking Water Standard (PDWS)** - MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

**Regulatory Action Level (AL)**- The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

**Maximum Residual Disinfectant Level (MRDL)** - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

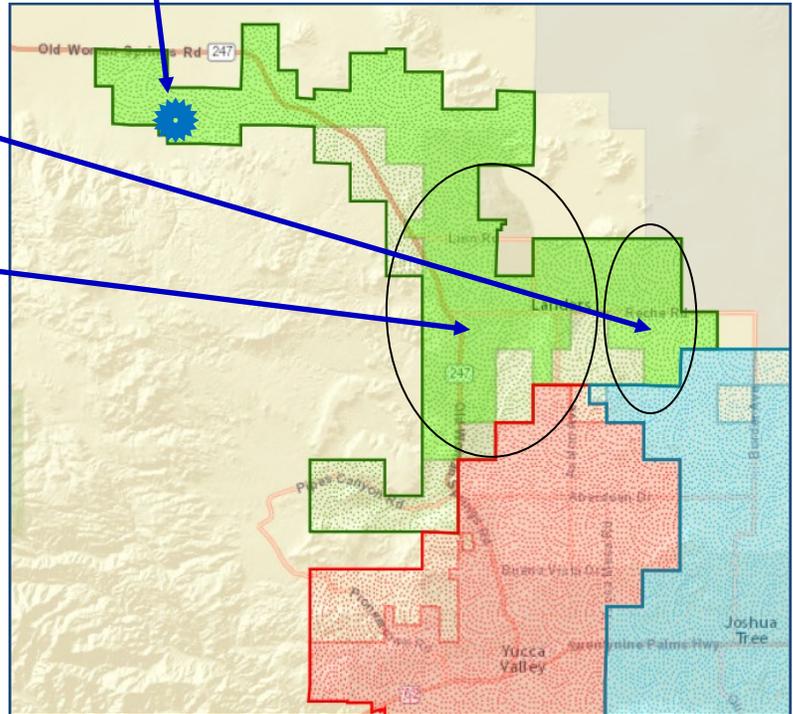

**Maximum Residual Disinfectant Level Goal (MRDLG)** - The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

## Three Distinct Water Systems

### Which one is yours?

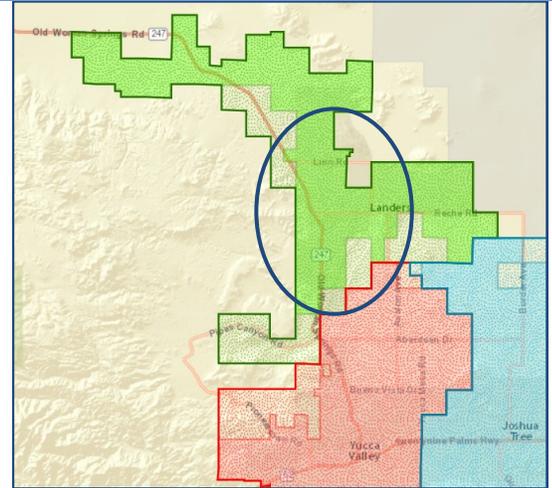

- Johnson Valley (pages 15-17), a bulk water hauling system summarizes the test results from Well 10. Located at Airport Rd/Quailbush Road.
- The Improvement District Goat Mountain (pages 12-14) summarizes test results from Wells GMW1 and GMW3.
- The Bighorn-Desert View (pages 9-11) summarizes test results from Wells 3, 6, 7, 8, and 9.

From January 1, 2019 to December 31, 2019 the Bighorn-Desert View Water Agency conducted over 1,650 water quality tests from samples taken at various locations throughout your water system in accordance with state and federal laws.

The following tables list only those contaminants that have been detected for the constituent as well as those required to be reported annually. The sample year indicates the latest year that one or more parameters were last tested. All sources are tested at least every 9 years, but not necessarily the same year. It is important to note that the presence of these constituents, as detected in water, does not necessarily indicate that the water poses a health risk. [BDVWA had no violations of a maximum contaminant level or secondary water quality standards in 2019.](#)

## Bighorn-Desert View Water Agency Service Area (Flamingo Heights and West Landers)

### Primary Standards (Mandatory Health Related Standards)

Chemical or Constituent	Units	Sample Year	Average Level Detected	Range of Detections	MCL	PHG (MCLG)	Typical Source of Contaminant
Arsenic	ppb	2019	2.4	ND - 4.9	10	0.004	Erosion of natural deposits; runoff from orchards; glass and electronics production wastes.
Fluoride	ppm	2019	0.87	0.59 - 1.2	2.0	1.0	Erosion of natural deposits; water additive that promotes strong teeth; discharge from fertilizer and aluminum factories.
Gross Alpha (Net)	pCi/L	2019	1	0 - 4	15	(0.0)	Erosion of natural deposits.
Nitrate as N (NO <sub>3</sub> -N)	ppm	2019	1.68	1.3 - 2.5	10	10	Runoff and leaching from fertilizer use; leaching from septic tanks and sewage; erosion of natural deposits.
Uranium	pCi/L	2019	7.4	1.8 - 13	20	0.43	Erosion of natural deposits.

### Coliform Bacteria — Nine samples collected monthly

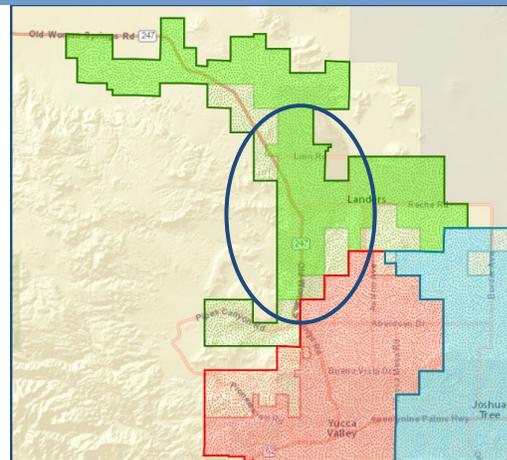

Microbiological Contaminants	Sample Year	Highest No. of Detections	No. of Months in Violation	MCL	PHG (MCLG)	Typical Source of Bacteria
Total Coliform Bacteria/State Total Coliform Rule	2018	0	0	More than 1 sample in a month with a detection.	(0)	Naturally present in the environment.

### Summary of Lead Testing at Schools within the Agency

Lead	Units	Sample Year	# of Schools in service area	# of Schools requesting testing	# of Samples	AVG.	Range	Violation
Lead	ppb	2017	1	1	5	ND	ND	No

Typical source of lead contamination in drinking water are internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits.

# Bighorn-Desert View Water Agency Service Area (Flamingo Heights and West Landers—Continued)

## Primary Standards (Mandatory Health Related Standards)

Lead & Copper Study	Units	Sample Year	No. of Samples Collected	90th Percentile Level Detected	No. of Sites Exceeding AL	AL	PHG (MCLG)	Typical Source of Contaminant
Lead	ppb	2019	22	ND	0	15	0.2	Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits.
Copper	ppm	2019	22	0.100	0	1.3	0.3	Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives.

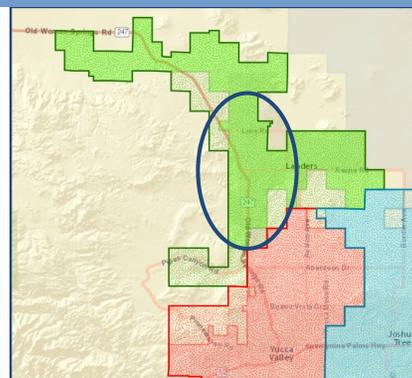

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Bighorn-Desert View Water Agency is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/lead> \*\*\* The next round of voluntary residential testing for Lead and Copper will take place between the months of June – September 2019. If you would like to be a participant in this free voluntary program please contact our office to determine if your residential plumbing materials make you vulnerable to lead and copper contamination .

## Detected Disinfection By-Products, Disinfectant Residual & Disinfection By-Product Precursors

	Units	Sample Year	BDVWA Average Level Detected	BDVWA Range of Detections	MCL [MDRL]	PHG [MRDLG]	Typical Source of Contaminant
Free Chlorine Residual (as CL2)	ppm	2019	0.71	0.40 - 1.16	[4]	[4]	Drinking water disinfectant added for treatment.
Total Trihalomethanes (TTHM)	ppb	2019	7.8	6.6	80	n/a	By-product of drinking water chlorination.
Total Haloacetic Acid (HAA5)	ppb	2019	ND	ND	60	n/a	By-product of drinking water disinfection.

All drinking water must be disinfected to ensure that any potentially dangerous microbes are neutralized. In order to prevent growth of these microbes as drinking water travels from our reservoirs through the distribution system to your home or business, a disinfectant residual must be maintained. We perform frequent and comprehensive monitoring to ensure that disinfectant levels remain in the proper range throughout our distribution system.

# Bighorn-Desert View Water Agency Service Area (Flamingo Heights and West Landers - Continued)

## Detected Regulated CCR Parameters with Secondary MCLs

Chemical or Constituent	Units	Sample Year	Average Level Detected	Range of Detections	MCL	PHG (MCLG)	Typical Source of
Chloride	ppm	2019	21	15 - 31	500	n/a	Runoff/leaching from natural deposits; seawater influence.
Odor (Total Odor)	OU	2019	1	1	3	n/a	Naturally-occurring organic materials.
Sulfate	ppm	2019	38.6	30 - 52	500	n/a	Runoff/leaching from natural deposits; industrial wastes.
Total Dissolved Solids	ppm	2019	289	240 - 330	1000	n/a	Runoff/leaching from natural deposits.
Turbidity	NTU	2019	0.23	ND - 0.5	5.0	n/a	Soil runoff.

## Detected Unregulated Parameters Requiring Monitoring

Chemical or Constituent	Units	Sample Year	Average Level Detected	Range of Detections	Notification Level	Health Effects Language
Boron	ppb	2019	87	ND - 140	1000	The babies of some pregnant woman who drink water containing boron in excess of the notification level may have an increased risk of developmental effects, based on studies in laboratory animals.
Vanadium	ppb	2019	11	4.9 - 22	50	The babies of some pregnant woman who drink water containing vanadium in excess of the notification level may have an increased risk of developmental effects, based on studies in laboratory animals.
Hexavalent Chromium (*)	ppb	2019	2.8	2.4 - 3.4	N/A	Erosion of natural deposits; discharge from electroplating factories, leather tanneries, wood preservation, chemical synthesis, refractory production and textile manufacturing facilities.

\* There is currently no MCL for hexavalent chromium. The previous MCL of 0.010 mg/L (10 ppb) was withdrawn on September 1, 2018. However, any hexavalent chromium results above the detection limit of 1 ppb should be reported.

## Other Parameters That May Be Of Interest

Chemical or Constituent	Units	Sample Year	Average Level Detected	Range of Detections	MCL	PHG (MCLG)	Typical Source of Contaminant
Sodium	ppm	2019	55	45 - 74	n/a	n/a	Salt present in the water and is generally naturally occurring.
Hardness	ppm	2019	97	52-120	n/a	n/a	Sum of polyvalent cations present in the water, generally magnesium and calcium and are usually naturally occurring.

**ADDITIONAL REQUIRED NOTICES BIGHORN-DESERT VIEW SERVICE AREA ONLY (FLAMINGO HEIGHTS AND WEST LADNDERS)**

IMPORTANT INFORMATION ABOUT YOUR DRINKING WATER  
Este informe contiene informacion muy importante sobre su agua potable.

Por favor hable con alguien que lo pueda traducir.

Our water system failed to monitor as required for drinking water standards during 2019 and, therefore was in violation of the regulations. Although this is not an emergency, as our customers, you have a right to know what happened, what you should do, and what we did to correct the situation.

We are required to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. During calendar year 2019, we did not collect nitrate samples from the sources listed in the table below and therefore, cannot be sure of the quality of our drinking water during that time.

**What should I do?**

- There is nothing you need to do at thistime.
- The table below lists the contaminant we did not properly test for during the calendar year 2019, how many samples we are required to take and how often, how many samples we took, when samples should have been taken, and the date on which follow-up samples will be taken.

Contaminant	Required sampling frequency	Number of samples taken	When all samples should have been taken	When samples will be taken
	Minimum is one			Samples were obtained on February 24, 2020
	sample annually			
Nitrate	from	None	During calendar year	
	WELL 08 WELL 09		2019	

If you have health issues concerning the consumption of this water, you may wish to consult your doctor.

**What happened? What is being done?** Wells 8 and 9 were offline during the month they were originally scheduled to be sampled (April 2019). Due to human error the samples were not obtained once the wells came back on-line. The missed samples were not detected until February 2020. The wells were sampled for Nitrate (Nitrate as N) on 2/24/2020. As in past years, the Nitrate levels measured are well-below the Maximum Level allowed.

**Corrective Action:** Sampled the wells in February 2020. The process for scheduling of sample collection has been amended to include additional quality control to minimize human errors in the future. This issue is fully resolved as of the date of this notice. Samples were obtained in February 2020 and laboratory analysis shows Nitrate levels continue to remain low at less than one-half of the Maximum Contaminant Level of 10 PPM.

For more information, please contact:

**Marina West**

Phone Number: 760-364-2315

Mailing Address: 622 Jemez Trail, Yucca Valley, CA 92284

*Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this public notice in a public place or distributing copies by hand or mail.*

## Secondary Notification Requirements

Upon receipt of notification from a person operating a public water system, the following notification must be given within 10 days [Health and Safety Code Section 116450(9)]:

SCHOOLS: Must notify school employees, students, and parents (if the students are minors).

RESIDENTIAL RENTAL PROPERTY OWNERS OR MANAGERS (including nursing homes and care facilities): Must notify tenants.

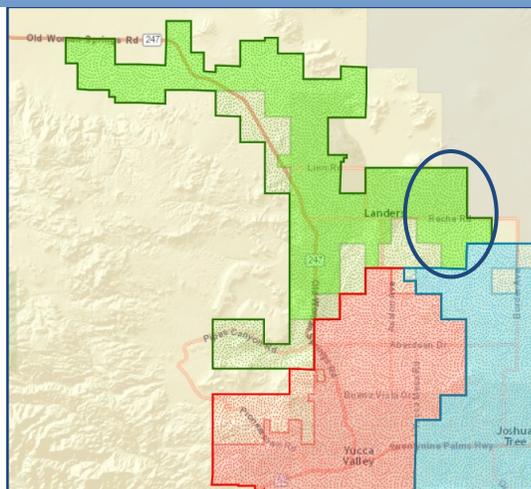

BUSINESS PROPERTY OWNERS, MANAGERS, OR OPERATORS: Must notify employees of businesses located on the property.

This notice is being sent to you by Bighorn - Desert View Water Agency in compliance with the California Domestic Water Quality and Monitoring Regulations as a means of keeping the public informed.

State Water System ID: 3610009      Date distributed: February 24, 2020

(This is a copy of the notice sent to affected customers in February 2020)

Microbiological Contaminants	Sample Year	Highest No. of Detections	No. of Months in Violation	MCL	PHG (MCLG)	Typical Source of Bacteria
Total Coliform Bacteria/State Total Coliform	2019	0	0	More than 1 sample in a month with a detection.	(0)	Naturally present in the environment.

## Summary of Lead Testing at Schools within the Agency

	Units	Sample Year	# of Schools in service area	# of Schools requesting testing	# of Samples	AVG.	Range	Violation
Lead	ppb	2017	0	0	2017	N/A	N/A	NO

Typical source of lead contamination in drinking water are internal corrosion of household water plumbing systems; discharge from industrial manufacturers; erosion of natural deposits.

## Bighorn-Desert View Water Agency Johnson Valley Well No. 10 Hauling Station (Continued)

### Detected Disinfection By-Products, Disinfectant Residual & Disinfection By-Product Precursors

	Units	Sample Year	BDVWA Average Results	BDVWA Range of Results	MCL (MDRL)	PHG (MRDLG)	Typical Source of Contaminant
Free Chlorine Residual (as CL <sub>2</sub> )	ppm	2019	0.67	0.47 - 0.83	[4]	[4]	Drinking water disinfectant added for treatment.
Total Trihalomethanes (TTHM)	ppb	2019	1.5	1.5	80	n/a	By-product of drinking water chlorination.
Total Haloacetic Acid (HAA5)	ppb	2019	ND	ND	60	n/a	By-product of drinking water disinfection.

*All drinking water must be disinfected to ensure that any potentially dangerous microbes are neutralized. In order to prevent growth of these microbes as drinking water travels from our reservoirs through the distribution system to your home or business, a disinfectant residual must be maintained. We perform frequent and comprehensive monitoring to ensure that disinfectant levels remain in the proper range throughout our distribution system.*

### Detected Regulated CCR Parameters with Secondary MCLs

Chemical or Constituent	Units	Sample Year	Level Detected	Range of Detection	MCL	PHG (MCLG)	Typical Source of
Chloride	ppm	2017	41.5	40 - 43	500	n/a	Runoff/leaching from natural deposits; seawater influence.
Odor (Total Odor)	OU	2017	2	2	3	n/a	Naturally-occurring organic materials.
Sulfate	ppm	2017	99.5	99 - 100	500	n/a	Runoff/leaching from natural deposits; industrial wastes.
Total Dissolved Solids	ppm	2017	340	340	1000	n/a	Runoff/leaching from natural deposits.
Turbidity	NTU	2017	1.6	0.2 - 3.1	5.0	n/a	Soil runoff.
Iron	ppb	2017	97.5	0 - 390	300	n/a	Leaching from natural deposits; industrial wastes.

### Detected Unregulated Parameters Requiring Monitoring

Chemical or Constituent	Units	Sample Year	Level Detected	Range of Detections	Notification Level	Health Effects Language
Boron	ppb	2017	195	190 - 200	1000	The babies of some pregnant woman who drink water containing boron in excess of the notification level may have an increased risk of developmental effects, based on studies in laboratory animals.
Vanadium	ppb	2017	20	19 - 21	50	The babies of some pregnant woman who drink water containing vanadium in excess of the notification level may have an increased risk of developmental effects, based on studies in laboratory animals.
Hexavalent Chromium	ppb	2017	4.0	4.0	N/A	Some people who drink water containing 1,2,3-Trichloropropane in excess of the MCL over many years may have an increased risk of getting cancer.

### Other Parameters That May Be Of Interest

Chemical or Constituent	Units	Sample Year	Average Level Detected	Range of Detections	MCL	PHG (MCLG)	Typical Source of Contaminant
Sodium	ppm	2017	99.5	99 - 100	N/A	N/A	Salt present in the water and is generally naturally occurring.
Hardness	ppm	2017	67	67	N/A	N/A	Sum of polyvalent cations present in the water, generally magnesium and calcium and are usually naturally occurring.

## Protect Your Groundwater!

Keep pollutants out of the Aquifer! Storm water often contains pollutants including chemicals, trash, and automobile fluids. To do your part in keeping our groundwater clean and safe, consider the following.....

- Your car can be a source of pollutants. Check your vehicle regularly for fluid leaks. Use a funnel to prevent spills. Use drip pans and drop cloths when making repairs and changing your oil.
- Dispose of construction waste and trash from around your yard. Yard waste has the potential to carry hazardous landscaping chemicals like pesticides.
- Items such as pharmaceuticals, solvents and drain cleaners can cause groundwater contamination and should never be flushed down the toilet or poured down the sink.
- Compost food scraps along with manure from horses, chickens and/or goats. Composting reduces the need for chemical fertilizers and helps plants absorb nutrients already in the soil and provides some extra nutrients too.

## Source Water Assessment

A drinking water source assessment was completed for all wells in the Bighorn-Desert View Water Agency water system in December 2002. The report indicates that Wells 3, 6, 7, 8, 9, and 10 are considered susceptible to septic leachate and erosion of natural deposits. A drinking water source assessment was completed for all wells in the Improvement District Goat Mountain water system in July 2012, prior to annexation to BDVWA effective July 1, 2015. The report indicates that wells GMW1 and GMW3 are considered susceptible to septic leachate, above ground storage tanks and wells. You may request a summary of the assessment be sent to you by contacting a Sanitary Engineer at the State Water Resources Control Board (Division of Drinking Water) at 909-383-4328. If you have questions about this report or want to learn more about the Agency, you may contact the Agency's General Manager, Marina D. West, PG at 760-364-2315. To learn more information about contaminants and potential health effects, call the USEPA's Safe Drinking Water Hotline at 1-800-426-4791 or visit their website at <http://www.epa.gov/ow/>.

## Community Participation

Our Regular Board of Directors Meetings are held on the second (2nd) Tuesday of each month at 6 PM at 1720 Cherokee Trail, Landers, CA 92252. Committees and Special Meetings occur throughout the year. The public is welcome and encouraged to attend. To confirm meeting dates, times, locations and agendas please **visit our website at [www.bdvwa.org](http://www.bdvwa.org)** or contact our **Customer Service Staff at 760-364-2315 or via email at [info@bdvwa.org](mailto:info@bdvwa.org)**.

## Office Location

Bighorn-Desert View Water Agency is located at 622 S. Jemez Trail, Yucca Valley, CA. Our office hours are 8:00 am to 4:30 pm Monday through Friday. The phone number is 760-364-2315. Please use the same phone number for after hours emergencies. When calling after hours you will be prompted to press an extension for "emergencies" and asked to leave a voice mail. If necessary, the on-call staff will return your call in a timely manner.

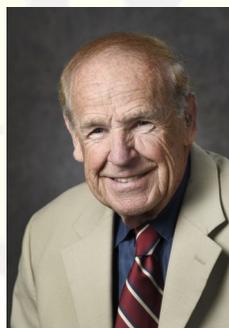

## 2019 Board of Directors
